

EaseUS Data Recovery Wizard User Guide

EaseUS Data Recovery Wizard is an easy-to-use data recovery software that allows you to easily recover lost data from PC, laptop, hard drive or USB drive. It has been endowed with a straightforward interface to ensure an efficient and smooth use for common users.

This User Manual includes a detailed instruction of how to use the program and all the features in this product. Any more questions or problems when using this product, please visit the Knowledge Base: <http://kb.easeus.com/>. Or contact our 24 hours Tech Support by emailing your issues to support@easeus.com.

1. Software Reference

System & Hardware Requirement

Operating System: Windows 10, Windows 8.1, Windows 8, Windows 7, Windows Vista, Windows XP, Windows Server 2012, Windows Server 2008, Windows Server 2003

File System: FAT(FAT12, FAT16, FAT32), exFAT, NTFS, NTFS5, ext2, ext3, HFS+

CPU: at least with x86.

RAM: at least 128 MB.

Disk Space: the minimum of the space for installing Data Recovery Wizard is 32 MB.

Supported Language

English, Deutsch, Español, Français, Italiano, Português, 日本語, Nederlands, 中文 (繁體), 中文 (简体), Svenska, Dansk, Русский, Norsk, Polski and Magyar.

Supported File Types

Basically, EaseUS Data Recovery Wizard supports common recovery job of all file types. However, in some specific cases, the file system directories/indexes are damaged, which makes the files can only be found from the content part of a partition. And files detected in this way are all known as **RAW files**.

Since not every file type share the same file structure and identifier (which our product use to locate a lost file and rebuild it as a RAW), so only a certain group of common file types can be retrieved as RAW files.

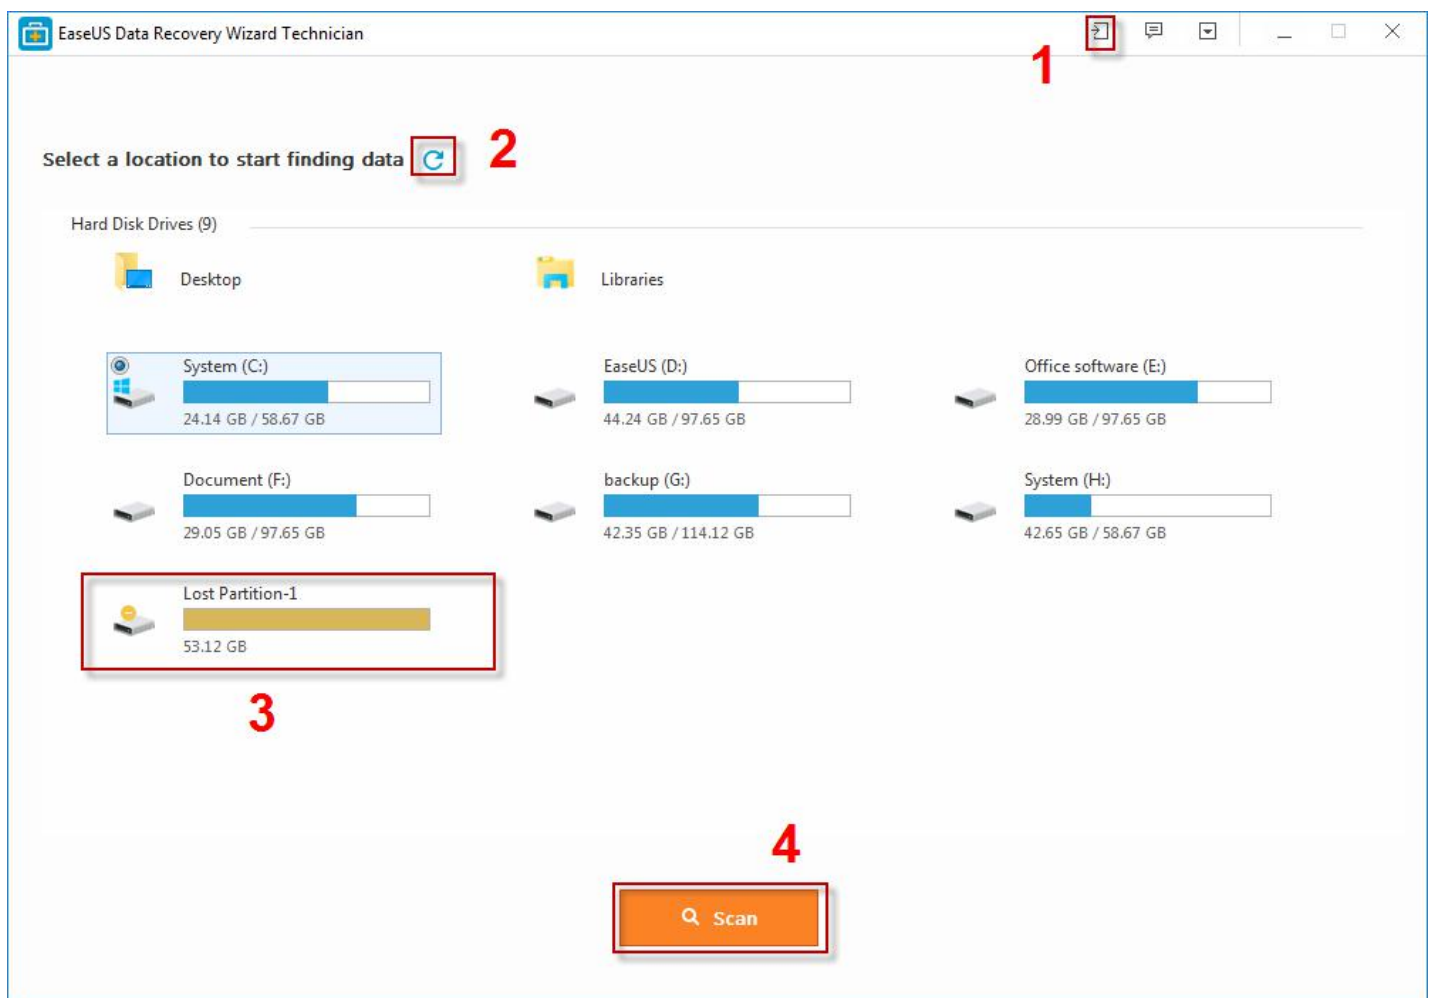

In short, for a partition which contains badly damaged or corrupted file directories/indexes, some very unusual file types cannot be recovered by our product.

2. Perform a Scan

Decide Scan Target

Since version 11.0, user only needs to define which is the target partition that needs to be scanned. If it is very clear that from where the files are deleted, then just select the partition or folder start the scan.

However, if the files lost due to partition lost or partition deleted, then just try to find a proper partition with similar capacity from Lost Partition area to proceed.

1. Keep you from another full scan by importing a scan status which exported previously.

2. Refresh hard drives to list any new added hard drives or try it when you cannot find the partition you want to scan in the list.

3. Lost Partition area, it appears only if you have any lost or deleted partition on the same computer before.

4. Click to start a scan, or you could just double click on any listed partition to do the same thing too.

Tips:

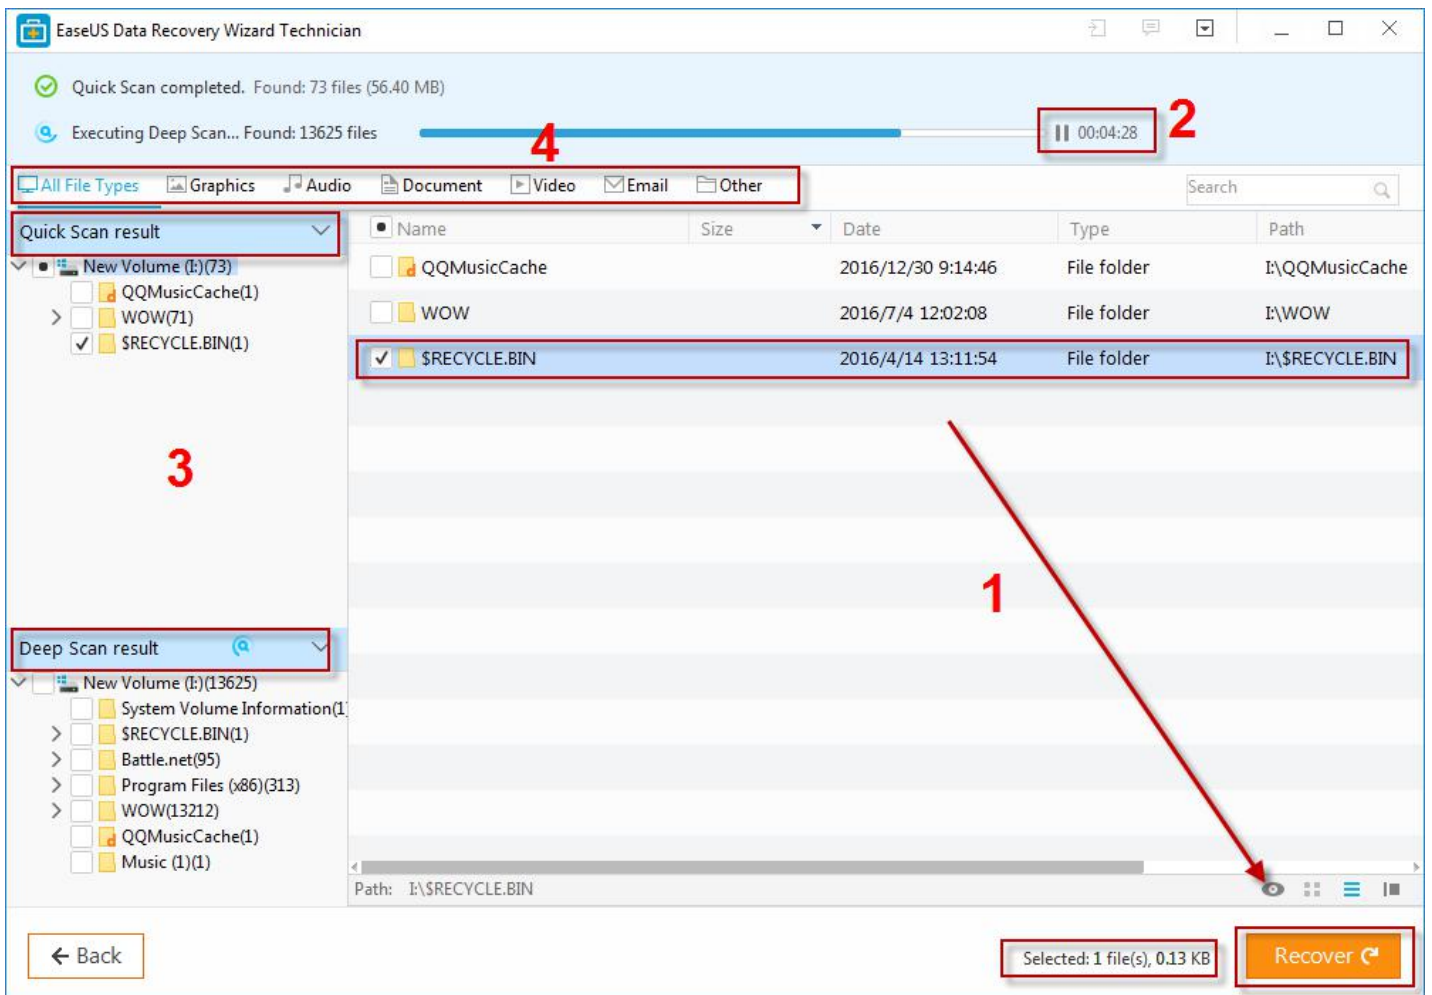

- *If the related partition or hard drive cannot be found in this step, please go to Windows Disk Management to see if Windows fails to recognize it too.*
- *Make sure the connection of the target partition or hard drive is stable, or the process may hang up or the files found will be 0KB in size.*
- *If the lost data is on the System partition, you are strongly suggested to disconnect the system hard drive and connect it to another computer to recover lost files, or use our [EaseUS Data Recovery Wizard Bootable Media to perform a recovery](#).*

Scan Process

A full scan of EaseUS Data Recovery Wizard consists of 2 part, Quick Scan and Deep Scan:

Quick scan - A fast scan only tries to rebuild files from every deleted flag in a file system.

Deep scan - Automatically start right after the quick scan, which not only fully checks the file directories/indexes to find more files, but also goes through every sector on the hard drive to find RAW files to increase the possibility of a successful recovery.

Although it is always suggested to wait patiently till the scan finishes, yet there are several options which may help you do some jobs to ease the whole recovery task in advance.

1. Once a file is confirmed in the scan, our product update it in the scan result panel in real time, and the file can be saved even the scan is still processing. Next to the **Recover** button, how many files are selected in total and their amount size is clearly stated to help you choose a proper device to save the files.

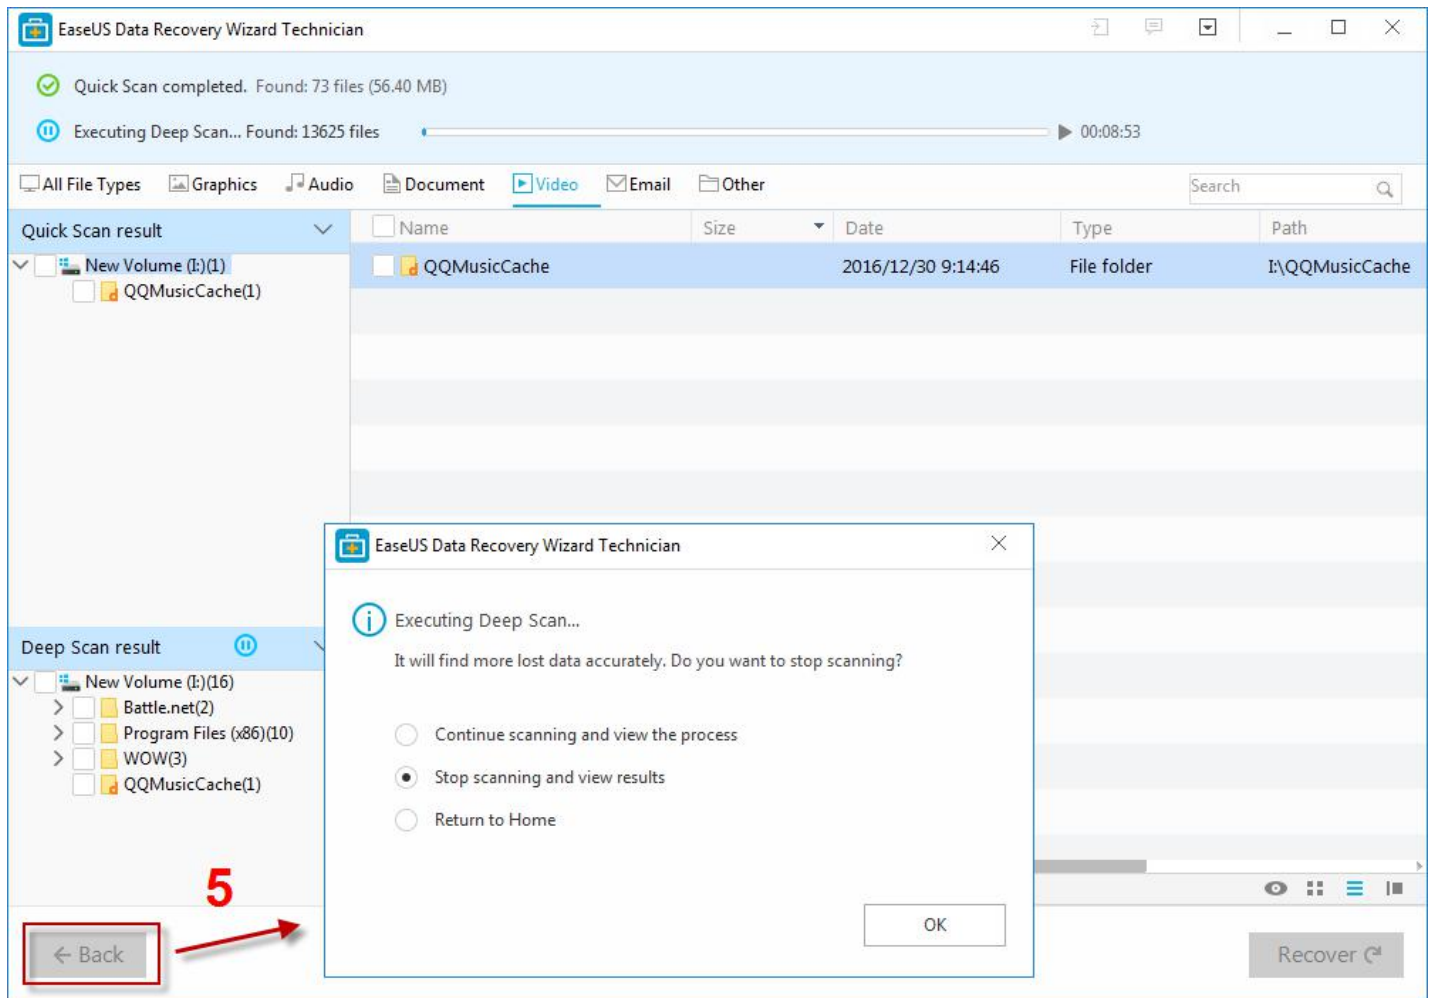

2. A Pause button can help you temporarily suspend the scan process if you have some other more important job to do, or you think all the files you want are already found and no any further scan is required.

Noted:

- *Quick Scan cannot be paused.*

3. Click the title bar of Quick Scan and Deep Scan to switch between the results of the 2 different scans. And Quick scan result is ready to be checked once Deep Scan starts.

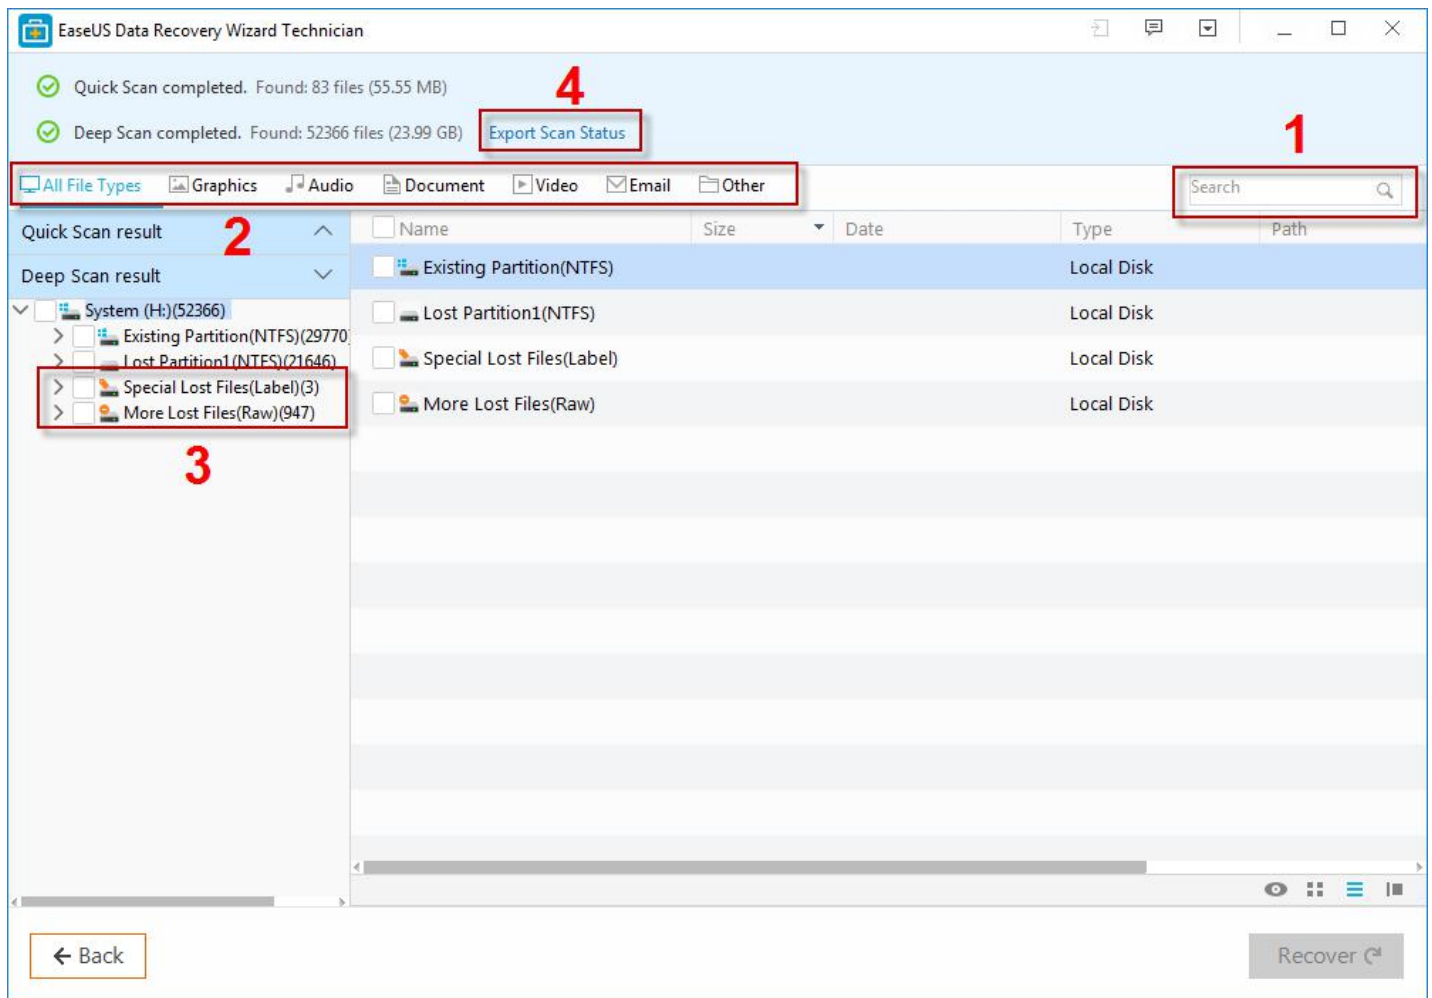

4. Only list a specific file type in the scan result to locate the files you want more accurately.

5. Anytime click on **Back** to pause the scan and get a menu to cancel current scan, return home or completely stop current scan to start looking for lost files.

3. Search for required files

Thousands of files may be listed after the deep scan. Though they are all organized in different categories, users may still have no idea how to find out where the required files are when facing such a huge amount of files. Here we suggest some useful methods which may significantly narrow down the files you need to look through:

1. If you still have part of the file name in mind or you just require a specific file extension, enter the key word in the search box to list all related files only.

2. Only list a specific file type in the scan result to locate the files you want more accurately.

3. More Lost Files and Special Lost files folder in Deep Scan result contains lots of RAW files, the RAW files are all found from the content part of a partition which has no original file name, file size and time stamp, but worth checking.

4. When the scan result is too large to be went through in one time, we offer the export option to help you export the scan result and allow you import it later for a direct use to avoid a new scan.

Noted:

- *Some files can be previewed before you save them, including doc, docx, xls, xlsx, txt, bmp, jeg, jpeg.*
- *For the case, file lost due to partition lost or become RAW, user needs to recover all files in the partition first, then rebuild the partition with the recovered files. There is no way to directly rebuild the partition with our product.*
